

AI-POWERED COLLEGE NOTICE ASSISTANT

NOTICE2ACTION

From College Notices to
Clear, Personalized Actions.

An Individual Project by ALAN BAIJU

Working prototype | Python | Streamlit | Groq API

Notices Arrive From Everywhere

Illustrative everyday scenario. No statistics are claimed.

The Gap Between Information and Action

THE CORE PROBLEM

Students receive information, but turning scattered notices into clear, personalized, and actionable tasks requires time and effort.

The challenge is not merely finding notices. It is converting unstructured information into useful decisions and next steps.

WHAT A STUDENT NEEDS TO KNOW

Does this apply to me?

Relevance to my profile

What must I do?

Required documents and steps

By when?

Deadlines and priority

Why Manual Methods Fall Short

Read long PDFs

Lengthy circulars must be read in full to find the key point.

Find what's relevant

Each notice has to be checked against your own situation.

Track deadlines

Dates sit inside paragraphs and are easy to overlook.

Work out actions

Required documents and next steps must be pieced together.

Time goes into interpreting notices, not acting on them.

Introducing Notice2Action

An AI-assisted web app that turns an uploaded PDF of college notices into structured, student-relevant action cards.

Focus: move from information to action.

Current workflow: upload a PDF. WhatsApp, Telegram and portal integrations are future possibilities only.

How It Works

Everything starts from one uploaded PDF.

System Architecture

 AI-assisted language understanding

 Conventional Python processing and rules

A hybrid approach

Personalization and Prioritization

Profile-based relevance

Student profile

Each notice compared

Relevant notices surface

Python logic matches notice details against the student's profile.

Priority indicators

HIGH

Health & immunization clearance

Documents are due before a deadline

MEDIUM

Career & internship fair; literary magazine submissions

Preparation or submission needed

LOW

Campus parking notice

Awareness; use the alternative area

Priority levels are shown as displayed in the prototype. The app does not learn student behavior or use advanced personalization models.

The User Interface

Screenshot 1: Profile controls and PDF upload

Screenshot 2: Notice cards with priority and actions

- 1 Profile controls

- 3 Notice cards
- 4 Priority & required action

From Raw Notice to Clear Action

Illustrative examples of the kind of information the prototype processes. Not independently verified college announcements, and not performance measurements.

The Prototype Is Live

LIVE WEB APP

<https://notice2action-ppdndd9hck3vpiskvwn3oy.streamlit.app/>

Hosted on Streamlit. Opens in any browser. Upload a PDF of college notices.

Review the cards

6

Read priority and
actions

Technology Stack

Python

Core language for segmentation, matching and priority logic.

Streamlit

Web interface for profile input, PDF upload and notice cards.

PyMuPDF

Extracts readable text from the uploaded PDF.

Groq API

Hosted language-model inference that helps analyze notice content.

Python rules

Conventional checks for relevance and priority.

Hosted LLM through the Groq API. No custom-trained model, no vector database, no RAG pipeline.

Capabilities and Limitations

Implemented today

- ✓ Accepts an uploaded PDF of college notices
- ✓ Extracts text and splits it into individual notices
- ✓ Uses AI to help extract structured details
- ✓ Matches notices against the student profile
- ✓ Assigns priority levels
- ✓ Shows structured cards with required actions

Current limitations

- ⚠ Needs a PDF upload; no automatic WhatsApp, Telegram or portal reading
- ⚠ Extracted and AI-generated details should be verified against the original notice
- ⚠ Results depend on readable text in the PDF
- ⚠ No formal accuracy evaluation yet
- ⚠ A working prototype, not production-ready

Future Scope

POSSIBLE FUTURE DIRECTIONS, NOT CURRENT FEATURES

Automated ingestion

Pull notices from approved college sources.

Calendar & reminders

Add deadlines to a calendar with reminders.

More formats

Support document types beyond PDF.

Better validation

Stronger extraction checks and formal evaluation.

Easier profiles

More convenient student-profile management.

Each item is a possibility for later versions. None is implemented in the current prototype.

Less time interpreting notices. More clarity about what to do next.
